- 
- **The Context**
 - **The Challenges**
 - **Case Example**

EPTISA Portfolio within India Smart Cities Mission

The Challenges

- **The highly complex and fragile urban ecosystem in Indian cities... that has been made more evident by rapid urbanization and its effects on housing, Mobility, sanitation, environmental problems...**
- **Filling the gaps between the Master Planning Stage and the implementation**
- **Prioritization of projects, sometimes involving conflicting interests**

The Challenges

There is a **DISCONNECT** between the actually existing city development, rapid urbanization, and its challenges, and the Smart Cities Mission primary goal of creating **rapid** wealth and **rapid** economic growth, by **quickly embedding technology in the built environment**

without first identifying and addressing, the basic city problems....

Case Study: The problem of traffic congestion and of sharing the public space....

BY&FORCITIZENS
European Conference on Smart,
Sustainable and Resilient Cities

When we see Indian roads as spaces of traffic congestion lacking spaces for parking, we see urban streets, as serving only the purpose of moving a variety of vehicles such as 2-3-4 wheelers, cars, trucks. Streets inside the walled city have begun to be regarded as **mere links in a road network**, enabling travel, and this has started to define how the streets are used

BY&FORCITIZENS
European Conference on Smart,
Sustainable and Resilient Cities

- Traffic congestion has been detected as one of the most serious issues that Indian Cities are facing...

- However, many streets in the India cities centers act as well as public “agoras” /spaces with the bazaars and the commercial activities tied to traders and retailers....

Redefinition of the problem

The initial problem: traffic congestion and lack of parking

The initial solution: Smart parking

In the Street as a shared space: the road becomes a **contested resource** among different uses and ownership-constellations, with a potential for conflict

Thus the problem that needs to be addressed is not traffic congestion and lack of parking, but how to **balance and unite stationary and mobile functions** in the street as a shared space.

smart solutions of the smart parking type, but also urban and/or transport planning, are very limited in addressing these issues

What maybe a possible alternative?

RE-FRAME the smart parking as an opportunity to rejuvenate the urban spaces around it (City-hall)

creating **MULTIFUNCTIONAL** public spaces **AND PARKING STRUCTURES** that capitalize on existing assets to promote health, happiness, and well-being, and to address different problems simultaneously such as lack of green space, flooding andparking if you like

That is, to solve several problems simultaneously with one and the same concept

....as the Smart parkings have already been built, re-Create it as a destination, as a multidimensional public space with a Smart parking below it
